Diffusion Approximations

We consider a diffusion process on the probability space $(\Omega, \mathcal{F}, \mathbb{P})$ of the form

$$X_t = x + \int_0^t m(X_s) ds + \int_0^t \sigma(X_s) dW_s.$$

Diffusion Approximations

We consider a diffusion process on the probability space $(\Omega, \mathcal{F}, \mathbb{P})$ of the form

$$X_t = x + \int_0^t m(X_s) ds + \int_0^t \sigma(X_s) dW_s.$$

- ▶ $\mathcal{F} = (\mathcal{F}_t)_{t \geq 0}$: natural filtration of X .

Diffusion Approximations

We consider a diffusion process on the probability space $(\Omega, \mathcal{F}, \mathbb{P})$ of the form

$$X_t = x + \int_0^t m(X_s) ds + \int_0^t \sigma(X_s) dW_s.$$

- ▶ $\mathcal{F} = (\mathcal{F}_t)_{t \geq 0}$: natural filtration of X .
- ▶ x : initial capital

Y is called **admissible**, if the following conditions hold:

- ▶ Y is adapted to $(\mathcal{F})_{t \geq 0}$.

Let $Y = (Y_t)_{t \geq 0}$ be a non-decreasing, non-anticipating process.
For the stochastic process X let

$$dX_t^Y = m(X_t^Y)dt + \sigma(X_t^Y)dW_t + dY_t \quad \text{with } X_0^Y = x.$$

The value connected to the strategy Y is

$$V^Y(x) = \mathbb{E}(\int_0^\infty e^{-\delta t} dY_t) \quad \text{with } \delta > 0 \text{ a discounting factor.}$$

Y is called **admissible**, if the following conditions hold:

- ▶ Y is adapted to $(\mathcal{F})_{t \geq 0}$.
- ▶ $\mathbb{P}(X_t^Y \geq 0 \text{ for all } t \geq 0) = 1$.

Let $Y = (Y_t)_{t \geq 0}$ be a non-decreasing, non-anticipating process.
For the stochastic process X let

$$dX_t^Y = m(X_t^Y)dt + \sigma(X_t^Y)dW_t + dY_t \quad \text{with } X_0^Y = x.$$

The value connected to the strategy Y is
 $V^Y(x) = \mathbb{E}(\int_0^\infty e^{-\delta t} dY_t)$ with $\delta > 0$ a discounting factor.

Y is called **admissible**, if the following conditions hold:

- ▶ Y is adapted to $(\mathcal{F})_{t \geq 0}$.
- ▶ $\mathbb{P}(X_t^Y \geq 0 \text{ for all } t \geq 0) = 1$.

By \mathcal{L}_x we denote the set of admissible strategies for an initial value x .

We are interested in the **value function** $V(x) = \inf_{Y \in \mathcal{L}_x} V^Y(x)$ with $\lim_{x \rightarrow \infty} V(x) = 0$ and in, if it exists, the **optimal strategy**.

We are interested in the **value function** $V(x) = \inf_{Y \in \mathcal{L}_x} V^Y(x)$ with $\lim_{x \rightarrow \infty} V(x) = 0$ and in, if it exists, the **optimal strategy**.

For the processes we consider, one should reinvest as late as possible and only as much as it is necessary to keep the process nonnegative. Thus the optimal strategy must be

We are interested in the **value function** $V(x) = \inf_{Y \in \mathcal{L}_x} V^Y(x)$ with $\lim_{x \rightarrow \infty} V(x) = 0$ and in, if it exists, the **optimal strategy**.

For the processes we consider, one should reinvest as late as possible and only as much as it is necessary to keep the process nonnegative. Thus the optimal strategy must be

$$Y_t^* = \sup_{0 \leq s \leq t} (-X_s) \vee 0,$$

i.e. the process reflected at 0.

We are interested in the **value function** $V(x) = \inf_{Y \in \mathcal{L}_x} V^Y(x)$ with $\lim_{x \rightarrow \infty} V(x) = 0$ and in, if it exists, the **optimal strategy**.

For the processes we consider, one should reinvest as late as possible and only as much as it is necessary to keep the process nonnegative. Thus the optimal strategy must be

$$Y_t^* = \sup_{0 \leq s \leq t} (-X_s) \vee 0,$$

i.e. the process reflected at 0.

By the principle of smooth fit it holds $V'(0) = -1$.

We are interested in the **value function** $V(x) = \inf_{Y \in \mathcal{L}_x} V^Y(x)$ with $\lim_{x \rightarrow \infty} V(x) = 0$ and in, if it exists, the **optimal strategy**.

For the processes we consider, one should reinvest as late as possible and only as much as it is necessary to keep the process nonnegative. Thus the optimal strategy must be

$$Y_t^* = \sup_{0 \leq s \leq t} (-X_s) \vee 0,$$

i.e. the process reflected at 0.

By the principle of smooth fit it holds $V'(0) = -1$.

S.E. Shreve, J.P. Lehoczky and D.P. Gaver showed that the HJB equation for this problem is solved by $V^{Y^*}(x)$ with boundary conditions $V'(0) = -1$ and $\lim_{x \rightarrow \infty} V(x) = 0$.

We are interested in the **value function** $V(x) = \inf_{Y \in \mathcal{L}_x} V^Y(x)$ with $\lim_{x \rightarrow \infty} V(x) = 0$ and in, if it exists, the **optimal strategy**.

For the processes we consider, one should reinvest as late as possible and only as much as it is necessary to keep the process nonnegative. Thus the optimal strategy must be

$$Y_t^* = \sup_{0 \leq s \leq t} (-X_s) \vee 0,$$

i.e. the process reflected at 0.

By the principle of smooth fit it holds $V'(0) = -1$.

S.E. Shreve, J.P. Lehoczky and D.P. Gaver showed that the HJB equation for this problem is solved by $V^{Y^*}(x)$ with boundary conditions $V'(0) = -1$ and $\lim_{x \rightarrow \infty} V(x) = 0$.

And S. Watanabe showed that the strategy Y^* is unique.

Solution for Brownian Motions

Shreve, Lechoczky and Gaver found the explicit solution for Brownian motions $X_t = x + mt + \sigma W_t$.

The value function has in this case the form

$$V(x) = \begin{cases} \frac{\sigma^2}{m + \sqrt{m^2 + 2\delta\sigma^2}} \exp\left(-\frac{m + \sqrt{m^2 + 2\delta\sigma^2}}{\sigma^2}x\right) & : x \geq 0 \\ \frac{\sigma^2}{m + \sqrt{m^2 + 2\delta\sigma^2}} - x & : x < 0. \end{cases}$$

Diffusion Approximations for a Classical Risk Model

The simplest diffusion approximation for a classical risk model can be obtained as follows:

Diffusion Approximations for a Classical Risk Model

The simplest diffusion approximation for a classical risk model can be obtained as follows:

Let $\lambda > 0$, $\eta \in (0, 1)$, $Z_i \geq 0$ iid, $\mu_k = \mathbb{E}(Z_i^k)$ and $(N_t^{(n)}) \sim P(n\lambda)$.
 Let further $X_t^{(n)}$ be a sequence of classical risk models:

$$X_t^{(n)} = x + \left[(1 + \eta/\sqrt{n})\lambda\mu_1\sqrt{n} \right] t - \sum_{i=1}^{N_t^{(n)}} Z_i/\sqrt{n}.$$

Diffusion Approximations for a Classical Risk Model

The simplest diffusion approximation for a classical risk model can be obtained as follows:

Let $\lambda > 0$, $\eta \in (0, 1)$, $Z_i \geq 0$ iid, $\mu_k = \mathbb{E}(Z_i^k)$ and $(N_t^{(n)}) \sim P(n\lambda)$.
 Let further $X_t^{(n)}$ be a sequence of classical risk models:

$$X_t^{(n)} = x + [(1 + \eta/\sqrt{n})\lambda\mu_1\sqrt{n}]t - \sum_{i=1}^{N_t^{(n)}} Z_i/\sqrt{n}.$$

As weak limit we obtain:

$$X_t = x + \lambda\mu_1\eta t + \sqrt{\lambda\mu_2}W_t,$$

where W_t is a standard Brownian motion.

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims
- ▶ λ : intensity of a Poisson process

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims
- ▶ λ : intensity of a Poisson process
- ▶ μ, μ_n : the first and the n 's moments of Z

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims
- ▶ λ : intensity of a Poisson process
- ▶ μ, μ_n : the first and the n 's moments of Z
- ▶ η and θ : safety coefficients of the insurer and reinsurer

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda\theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims
- ▶ λ : intensity of a Poisson process
- ▶ μ, μ_n : the first and the n 's moments of Z
- ▶ η and θ : safety coefficients of the insurer and reinsurer
- ▶ B and b : reinsurance strategy and corresponding deductible

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims
- ▶ λ : intensity of a Poisson process
- ▶ μ, μ_n : the first and the n 's moments of Z
- ▶ η and θ : safety coefficients of the insurer and reinsurer
- ▶ B and b : reinsurance strategy and corresponding deductible
- ▶ $r(Z, b)$: continuous self-insurance function

Diffusion Approximations with Reinsurance

We consider now diffusion approximations to a classical risk process where the claims are reinsured by some reinsurance:

$$dX_t^B = \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b_t)) \right] dt + \sqrt{\lambda \mathbb{E}(r(Z, b_t)^2)} dW_t.$$

- ▶ Z : generic random variable, representing claims
- ▶ λ : intensity of a Poisson process
- ▶ μ, μ_n : the first and the n 's moments of Z
- ▶ η and θ : safety coefficients of the insurer and reinsurer
- ▶ B and b : reinsurance strategy and corresponding deductible
- ▶ $r(Z, b)$: continuous self-insurance function

$b \in [0, \tilde{b}]$ with $b = 0$ meaning “full reinsurance” and $b = \tilde{b}$ meaning “no reinsurance”.

Let \mathcal{U} be the set of adapted strategies, i.e. strategies $B = (b_t)_{t \geq 0}$ with $b_t \in [0, \tilde{b}]$.

We denote the value connected to the strategy

$$Y_t^B = \sup_{0 \leq s \leq t} (-X_s^B) \vee 0 \text{ by } V^B(x) \text{ and define the value function}$$

$$\text{again as } V(x) = \inf_{B \in \mathcal{U}} V^B(x).$$

Let \mathcal{U} be the set of adapted strategies, i.e. strategies $B = (b_t)_{t \geq 0}$ with $b_t \in [0, \tilde{b}]$.

We denote the value connected to the strategy

$$Y_t^B = \sup_{0 \leq s \leq t} (-X_s^B) \vee 0 \text{ by } V^B(x) \text{ and define the value function}$$

$$\text{again as } V(x) = \inf_{B \in \mathcal{U}} V^B(x).$$

Let $\tau_x^B = \inf\{t \geq 0 : X_t^B < 0, X_0^B = x\}$ be the ruin time.

Let \mathcal{U} be the set of adapted strategies, i.e. strategies $B = (b_t)_{t \geq 0}$ with $b_t \in [0, \tilde{b}]$.

We denote the value connected to the strategy

$Y_t^B = \sup_{0 \leq s \leq t} (-X_s^B) \vee 0$ by $V^B(x)$ and define the value function

again as $V(x) = \inf_{B \in \mathcal{U}} V^B(x)$.

Let $\tau_x^B = \inf\{t \geq 0 : X_t^B < 0, X_0^B = x\}$ be the ruin time.

Then we can write

$$V^B(x) = V^B(0)\mathbb{E}(e^{-\delta\tau_x^B}).$$

Let \mathcal{U} be the set of adapted strategies, i.e. strategies $B = (b_t)_{t \geq 0}$ with $b_t \in [0, \tilde{b}]$.

We denote the value connected to the strategy

$Y_t^B = \sup_{0 \leq s \leq t} (-X_s^B) \vee 0$ by $V^B(x)$ and define the value function

again as $V(x) = \inf_{B \in \mathcal{U}} V^B(x)$.

Let $\tau_x^B = \inf\{t \geq 0 : X_t^B < 0, X_0^B = x\}$ be the ruin time.

Then we can write

$$V^B(x) = V^B(0) \mathbb{E}(e^{-\delta \tau_x^B}).$$

In order to minimize $V^B(x)$, we have to minimize

$L^B(x) := \mathbb{E}(e^{-\delta \tau_x^B})$ and find $L(x) := \inf_{B \in \mathcal{U}} L^B(x)$.

$L(x)$ is an Exponential Function

Let $x, y \in \mathbb{R}_+$ and B the optimal strategy, i.e. we assume that there is an optimal strategy, then we have

$L(x)$ is an Exponential Function

Let $x, y \in \mathbb{R}_+$ and B the optimal strategy, i.e. we assume that there is an optimal strategy, then we have

$$V^B(x + y) = V^B(y)\mathbb{E}(e^{-\delta\tau_x^B}) = V^B(0)\mathbb{E}(e^{-\delta\tau_y^B})\mathbb{E}(e^{-\delta\tau_x^B})$$

$L(x)$ is an Exponential Function

Let $x, y \in \mathbb{R}_+$ and B the optimal strategy, i.e. we assume that there is an optimal strategy, then we have

$$\begin{aligned}V^B(x+y) &= V^B(y)\mathbb{E}(e^{-\delta\tau_x^B}) = V^B(0)\mathbb{E}(e^{-\delta\tau_y^B})\mathbb{E}(e^{-\delta\tau_x^B}) \\V^B(x+y) &= V^B(0)\mathbb{E}(e^{-\delta\tau_{x+y}^B}).\end{aligned}$$

$L(x)$ is an Exponential Function

Let $x, y \in \mathbb{R}_+$ and B the optimal strategy, i.e. we assume that there is an optimal strategy, then we have

$$\begin{aligned} V^B(x+y) &= V^B(y)\mathbb{E}(e^{-\delta\tau_x^B}) = V^B(0)\mathbb{E}(e^{-\delta\tau_y^B})\mathbb{E}(e^{-\delta\tau_x^B}) \\ V^B(x+y) &= V^B(0)\mathbb{E}(e^{-\delta\tau_{x+y}^B}). \end{aligned}$$

Consequently $L(x) = L^B(x)$ is an exponential function in x .

$L(x)$ is an Exponential Function

Let $x, y \in \mathbb{R}_+$ and B the optimal strategy, i.e. we assume that there is an optimal strategy, then we have

$$\begin{aligned} V^B(x+y) &= V^B(y)\mathbb{E}(e^{-\delta\tau_x^B}) = V^B(0)\mathbb{E}(e^{-\delta\tau_y^B})\mathbb{E}(e^{-\delta\tau_x^B}) \\ V^B(x+y) &= V^B(0)\mathbb{E}(e^{-\delta\tau_{x+y}^B}). \end{aligned}$$

Consequently $L(x) = L^B(x)$ is an exponential function in x .

Because $V^B(x)$ is decreasing in x and $\frac{dV^B}{dx}(0) = -1$, there is $\beta(B) > 0$ independent of x with $L^B(x) = \exp(-\beta(B)x)$.

$L(x)$ is an Exponential Function

Let $x, y \in \mathbb{R}_+$ and B the optimal strategy, i.e. we assume that there is an optimal strategy, then we have

$$\begin{aligned} V^B(x+y) &= V^B(y)\mathbb{E}(e^{-\delta\tau_x^B}) = V^B(0)\mathbb{E}(e^{-\delta\tau_y^B})\mathbb{E}(e^{-\delta\tau_x^B}) \\ V^B(x+y) &= V^B(0)\mathbb{E}(e^{-\delta\tau_{x+y}^B}). \end{aligned}$$

Consequently $L(x) = L^B(x)$ is an exponential function in x .

Because $V^B(x)$ is decreasing in x and $\frac{dV^B}{dx}(0) = -1$, there is $\beta(B) > 0$ independent of x with $L^B(x) = \exp(-\beta(B)x)$.

On the other hand $\beta(B)$ independent of x means B is independent of x , i.e. $B = b$ is a constant strategy.

HJB Equation

In order to find the optimal constant strategy b^* we consider the Hamilton-Jacobi-Bellman equation for the function $L(x)$:

$$\inf_{b \in [0, \tilde{b}]} \frac{\lambda \mathbb{E}(r(Z, b)^2)}{2} L''(x) + \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b)) \right] L'(x) - \delta L(x) = 0.$$

HJB Equation

In order to find the optimal constant strategy b^* we consider the Hamilton-Jacobi-Bellman equation for the function $L(x)$:

$$\inf_{b \in [0, \tilde{b}]} \frac{\lambda \mathbb{E}(r(Z, b)^2)}{2} L''(x) + \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b)) \right] L'(x) - \delta L(x) = 0.$$

If there is an optimal strategy b^* , i.e. $L(x) = L^{b^*}(x)$, then the value function is also an exponential function and the HJB equation has the form:

HJB Equation

In order to find the optimal constant strategy b^* we consider the Hamilton-Jacobi-Bellman equation for the function $L(x)$:

$$\inf_{b \in [0, \tilde{b}]} \frac{\lambda \mathbb{E}(r(Z, b)^2)}{2} L''(x) + \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b)) \right] L'(x) - \delta L(x) = 0.$$

If there is an optimal strategy b^* , i.e. $L(x) = L^{b^*}(x)$, then the value function is also an exponential function and the HJB equation has the form:

$$\frac{\lambda \mathbb{E}(r(Z, b^*)^2)}{2} \beta(b^*)^2 + \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b^*)) \right] \beta(b^*) - \delta = 0,$$

i.e. a quadratic equation in $\beta(b^*)$.

Existence of a Solution

With notation $\alpha(b) = \lambda\theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b)) \right]$, $b \neq 0$ we obtain

$$\beta(b) = [\lambda \mathbb{E}(r(Z, b)^2)]^{-1} \left[\alpha(b) + \sqrt{\alpha(b)^2 + 2\delta \lambda \mathbb{E}(r(Z, b)^2)} \right] > 0$$

as a positive solution to the HJB equation.

Existence of a Solution

With notation $\alpha(b) = \lambda\theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b)) \right]$, $b \neq 0$ we obtain

$$\beta(b) = [\lambda \mathbb{E}(r(Z, b)^2)]^{-1} \left[\alpha(b) + \sqrt{\alpha(b)^2 + 2\delta \lambda \mathbb{E}(r(Z, b)^2)} \right] > 0$$

as a positive solution to the HJB equation.

If we set $\beta(0) = 0$, then $\beta(b)$ is continuous on the set $[0, \tilde{b}]$ and has therefore a maximum in $(0, \tilde{b}]$.

Existence of a Solution

With notation $\alpha(b) = \lambda\theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(r(Z, b)) \right]$, $b \neq 0$ we obtain

$$\beta(b) = [\lambda \mathbb{E}(r(Z, b)^2)]^{-1} \left[\alpha(b) + \sqrt{\alpha(b)^2 + 2\delta\lambda \mathbb{E}(r(Z, b)^2)} \right] > 0$$

as a positive solution to the HJB equation.

If we set $\beta(0) = 0$, then $\beta(b)$ is continuous on the set $[0, \tilde{b}]$ and has therefore a maximum in $(0, \tilde{b}]$.

Because $V^b(x) = \frac{1}{\beta(b)} \exp(-\beta(b)x)$ the minimum of $V^b(x)$ in b is at the same time the maximum of $\beta(b)$.

Verification Theorem

Verification theorem:

There is a $b^* \in (0, \tilde{b}]$ with $L(x) = \exp(-\beta(b^*)x)$. The constant strategy $B = b^*$ is an optimal reinsurance strategy, whereas b^* is a maximum point of $\beta(b)$.

The corresponding value function has the form:

$$V^{b^*}(x) = \begin{cases} \frac{1}{\beta(b^*)} e^{-\beta(b^*)x} & : x \geq 0 \\ \frac{1}{\beta(b^*)} - x & : x < 0. \end{cases}$$

The uniqueness of the optimal strategy, as the case may be, can be shown for a concrete function $r(Z, b)$.

Proportional Reinsurance

Consider the proportional reinsurance, i.e. $r(Z, b) = bZ$, $b \in [0, 1]$.

Proportional Reinsurance

Consider the proportional reinsurance, i.e. $r(Z, b) = bZ$, $b \in [0, 1]$.

We set $\lambda\mu = 1$, $\sqrt{\lambda\mu_2} = \sigma$ and $b_0 = 1 - \frac{\eta}{\theta}$ and consider the process

$$X_t^b = x + (b\theta - (\theta - \eta))t + b\sigma W_t.$$

Proportional Reinsurance

Consider the proportional reinsurance, i.e. $r(Z, b) = bZ$, $b \in [0, 1]$.

We set $\lambda\mu = 1$, $\sqrt{\lambda\mu_2} = \sigma$ and $b_0 = 1 - \frac{\eta}{\theta}$ and consider the process

$$X_t^b = x + (b\theta - (\theta - \eta))t + b\sigma W_t.$$

It is easy to verify, that the optimal constant strategy b^* is given through:

$$b^* = \begin{cases} 1 & : \theta \geq \eta + \sqrt{\eta^2 + 2\delta\sigma^2} \\ \frac{2b_0}{1+2\delta\sigma^2/\theta^2} & : \eta < \theta < \eta + \sqrt{\eta^2 + 2\delta\sigma^2}. \end{cases}$$

Choose for example $\theta = 0.5$, $\eta = 0.3$, $\lambda = 0.05$, $\delta = 0.04$ and $\mu_2 = 80$. Then we have for the optimal deductible $b^* = 0.351 < 1$. In this case it holds:

$$V^{0.351}(x) = \begin{cases} 0.235^{-1} e^{-0.235x} & : x \geq 0 \\ 0.235^{-1} - x & : x < 0. \end{cases}$$

Choose for example $\theta = 0.5$, $\eta = 0.3$, $\lambda = 0.05$, $\delta = 0.04$ and $\mu_2 = 80$. Then we have for the optimal deductible $b^* = 0.351 < 1$. In this case it holds:

$$V^{0.351}(x) = \begin{cases} 0.235^{-1} e^{-0.235x} & : x \geq 0 \\ 0.235^{-1} - x & : x < 0. \end{cases}$$

The parameters $\theta = 0.8$, $\eta = 0.2$, $\lambda = 0.05$, $\delta = 0.04$ and $\mu_2 = 80$ yield $b^* = 1$, i.e. the value function:

$$V^1(x) = \begin{cases} 0.356^{-1} e^{-0.356x} & : x \geq 0 \\ 0.356^{-1} - x & : x < 0. \end{cases}$$

Value functions for optimal strategies $b^* = 1$ and $b^* = 0.351$.

Excess of Loss Reinsurance

Consider now the Excess of Loss reinsurance with deductible $b \in [0, \infty]$.

Excess of Loss Reinsurance

Consider now the Excess of Loss reinsurance with deductible $b \in [0, \infty]$.

For a claim Z the insurer pays $\min(Z, b)$ and the reinsurer pays $(Z - b)^+$, i.e. $r(Z, b) = \min(Z, b)$. And we consider the process

$$X_t^b = x + \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(\min(Z, b)) \right] t + \sqrt{\lambda \mathbb{E}(\min(Z, b)^2)} W_t.$$

Excess of Loss Reinsurance

Consider now the Excess of Loss reinsurance with deductible $b \in [0, \infty]$.

For a claim Z the insurer pays $\min(Z, b)$ and the reinsurer pays $(Z - b)^+$, i.e. $r(Z, b) = \min(Z, b)$. And we consider the process

$$X_t^b = x + \lambda \theta \left[\left(\frac{\eta}{\theta} - 1 \right) \mu + \mathbb{E}(\min(Z, b)) \right] t + \sqrt{\lambda \mathbb{E}(\min(Z, b)^2)} W_t.$$

We assume $\mathbb{E}(Z^2) < \infty$.

Value function for $Z \sim \text{Exp}(\frac{1}{\mu})$

We consider at first the function

$$\beta(b) = [\lambda \mathbb{E}(\min(Z, b)^2)]^{-1} \left[\alpha(b) + \sqrt{\alpha(b)^2 + 2\delta \lambda \mathbb{E}(\min(Z, b)^2)} \right]$$

and show, that there is a unique $b^* \in \left(\frac{2\mu\theta^2\lambda(1-\eta/\theta)}{2\delta+\theta^2\lambda}, \frac{\mu\theta^2\lambda(1-\eta/\theta)}{\delta} \right)$.

Value function for $Z \sim \text{Exp}(\frac{1}{\mu})$

We consider at first the function

$$\beta(b) = [\lambda \mathbb{E}(\min(Z, b)^2)]^{-1} \left[\alpha(b) + \sqrt{\alpha(b)^2 + 2\delta \lambda \mathbb{E}(\min(Z, b)^2)} \right]$$

and show, that there is a unique $b^* \in \left(\frac{2\mu\theta^2\lambda(1-\eta/\theta)}{2\delta+\theta^2\lambda}, \frac{\mu\theta^2\lambda(1-\eta/\theta)}{\delta} \right)$.

We assume $Z \sim \text{Exp}(\frac{1}{\mu})$ and obtain for the parameters $\theta = 0.5$, $\eta = 0.3$, $\lambda = 0.05$, $\delta = 0.04$ and $\mu_2 = 80$ the value function

$$V^{2.173}(x) = \begin{cases} 0.23^{-1} e^{-0.23x} & : x \geq 0 \\ 0.23^{-1} - x & : x < 0. \end{cases}$$

Value functions for the XL (V_{XL}) and proportional (V_P) reinsurances with the same parameters $\theta = 0.5$, $\eta = 0.3$, $\lambda = 0.05$, $\delta = 0.04$ and $\mu_2 = 80$.
