# Alperin's Weight Conjecture

Assumptions: Let  $G$  be a finite group and  $k$  be an algebraically closed field with characteristic  $p > 0$ .

# Alperin's Weight Conjecture

Assumptions: Let  $G$  be a finite group and  $k$  be an algebraically closed field with characteristic  $p > 0$ .

## Definition and Remark

Let  $X$  be an indecomposable  $kG$ -module.

- 1 Let  $H \leq G$ . Then  $X$  is called  **$H$ -projective**, if  $X \mid (X_H)^G$ .
- 2 Any minimal subgroup  $Q$  of  $G$  such that  $X$  is  $Q$ -projective is called a **vertex** of  $X$ .
- 3 Vertices are  $p$ -subgroups of  $G$ . The set of vertices of  $X$  is a conjugacy-class of  $G$ .

# Alperin's Weight Conjecture

## Theorem (Green Correspondence)

Let  $Q \leq G$  be a  $p$ -subgroup and  $N_G(Q) \leq H \leq G$ . Then there is a one-to-one-correspondence between

$$\begin{array}{c} \{X : X \text{ indecomposable } kG\text{-module with vertex } Q\} \cong \\ \begin{array}{c} \uparrow g \\ \downarrow f \end{array} \\ \{Y : Y \text{ indecomposable } kH\text{-module with vertex } Q\} \cong \end{array}$$

given via

- 1  $X_H = f(X) \oplus Z$ , where each indecomposable direct summand of  $Z$  has a vertex in  $\{Q^g \cap H : g \in G \setminus H\}$ ,
- 2  $Y^G = g(Y) \oplus W$ , where each indecomposable direct summand of  $W$  has a vertex in  $\{Q^g \cap Q : g \in G \setminus H\}$ .

# Alperin's Weight Conjecture

## Definition

A **weight for  $G$**  is a tuple  $(Q, S)$ , where  $Q$  is a  $p$ -subgroup of  $G$  and  $S$  is a simple  $kN_G(Q)$ -module with vertex  $Q$ . In this case, we call  $S$  a **weight module** and the Green correspondent  $g(S)$  of  $S$  in  $G$  a **weight Green correspondent (WGC)**.

# Alperin's Weight Conjecture

## Definition

A **weight for  $G$**  is a tuple  $(Q, S)$ , where  $Q$  is a  $p$ -subgroup of  $G$  and  $S$  is a simple  $kN_G(Q)$ -module with vertex  $Q$ . In this case, we call  $S$  a **weight module** and the Green correspondent  $g(S)$  of  $S$  in  $G$  a **weight Green correspondent (WGC)**.

- Weights are understood up to the natural equivalence  $\simeq$  induced by conjugation of  $G$ .
- $(Q, S)$  is a weight if and only if  $S$  is a simple and projective  $kN_G(Q)/Q$ -module.
- Any WGC is (isomorphic to) a direct summand of the permutation module  $k_P^G$ , where  $P \in \text{Syl}_p(G)$ .

# Alperin's Weight Conjecture

## Conjecture (Alperin's Weight Conjecture, 1987)

The number of simple  $kG$ -modules (up to isomorphism) is equal to the number of weights for  $G$  (up to equivalence).

- Let  $Y := k_P^G = \bigoplus_{i=1}^n Y_i$  be a decomposition of  $k_P^G$  into indecomposable direct summands and put  $E := \text{End}_{kG}(Y)$ .
- For  $\varphi \in E$ ,  $\varphi(y)$  denotes the image of  $y \in Y$  under  $\varphi$ .
- The Hom-Functor  $\text{Hom}_{kG}(Y, -) : \text{mod-}kG \rightarrow \text{mod-}E$  induces a decomposition of  $E_E$  into the PIMs  $P_i := \text{Hom}_{kG}(Y, Y_i)$  (Fitting Correspondence).
- Of course,  $\text{hd}(P_i)$  is a simple  $E$ -module, but  $\text{soc}(P_i)$  is in general not simple.

With the computer algebra programmes GAP, MeatAxe:

With the computer algebra programmes GAP, MeatAxe:

- Construct  $Y = k_P^G$ ,  $Y = \bigoplus_{i=1}^n Y_i$ ,  $E_E$ ,  $E_E = \bigoplus_{i=1}^n P_i$ .
- Analyze  $\text{hd}(Y_i)$ ,  $\text{soc}(Y_i)$ ,  $\text{hd}(P_i)$ ,  $\text{soc}(P_i)$ .
- Determine character table, the Cartan- and decomposition matrix of  $E$ .

# Computational Experiments

With the computer algebra programmes GAP, MeatAxe:

- Construct  $Y = k_P^G$ ,  $Y = \bigoplus_{i=1}^n Y_i$ ,  $E_E$ ,  $E_E = \bigoplus_{i=1}^n P_i$ .
- Analyze  $\text{hd}(Y_i)$ ,  $\text{soc}(Y_i)$ ,  $\text{hd}(P_i)$ ,  $\text{soc}(P_i)$ .
- Determine character table, the Cartan- and decomposition matrix of  $E$ .

## Observation

For almost all groups analyzed so far:

$$|\{\text{simple constituents of } \text{soc}(E_E)\}_{\cong}|$$

$$|\{\text{simple } kG\text{-modules}\}_{\cong}| \quad |\{\text{weights for } G\}_{\simeq}|$$

# Computational Experiments

With the computer algebra programmes GAP, MeatAxe:

- Construct  $Y = k_P^G$ ,  $Y = \bigoplus_{i=1}^n Y_i$ ,  $E_E$ ,  $E_E = \bigoplus_{i=1}^n P_i$ .
- Analyze  $\text{hd}(Y_i)$ ,  $\text{soc}(Y_i)$ ,  $\text{hd}(P_i)$ ,  $\text{soc}(P_i)$ .
- Determine character table, the Cartan- and decomposition matrix of  $E$ .

## Observation

For almost all groups analyzed so far:

$$\begin{array}{ccc} |\{\text{simple constituents of } \text{soc}(E_E)\}_{/\cong}| & & \\ \parallel & & \parallel \\ |\{\text{simple } kG\text{-modules}\}_{/\cong}| & = & |\{\text{weights for } G\}_{/\cong}| \end{array}$$

Exception:  $M_{11}$  in characteristic 3.

From this, the following questions and ideas arise:

- Generalize analysis to more general modules than  $k_P^G$ , e.g.  $\oplus k_{Q_i}^G$  for certain  $p$ -subgroups  $Q_i$  of  $G$ .
- Which role does the Hom-functor, and especially its evaluation at a simple  $kG$ -module play?
- Characterize families of groups for which the observation hold.

# $M_{11}$ in characteristic 3

$\mathcal{F} := \text{Hom}_{kG}(Y, -)$  evaluated at simple  $kG$ -module - what can happen?

$\mathcal{F} := \text{Hom}_{kG}(Y, -)$  evaluated at simple  $kG$ -module - what can happen?

- In general:  $\mathcal{F}(S)$  for a simple  $kG$ -module  $S$  not simple.

For example:  $A_6$  in characteristic 5:  $\mathcal{F}(8) = \begin{matrix} 1_a \\ 1_b \end{matrix}$ .

- Even  $\text{soc}(\mathcal{F}(S))$  may not be simple.

For example:  $M_{11}$  in characteristic 3. Then  $\mathcal{F}(10_3) = 1_5 \oplus 2_3$ .

# Hom-Functor

Assumptions for this section:

Assumptions for this section:

- Consider some  $kG$ -module  $Y$  such that  $\{S : S \mid \text{hd}(Y) \text{ simple}\} / \cong = \{T : T \mid \text{soc}(Y)\} / \cong$ .
- Let  $Y = \bigoplus_{i=1}^n Y_i$  be a decomposition into indecomposable direct summands.
- Assume: Head of  $Y_i$  is simple for all  $1 \leq i \leq n$ .
- $Y_i \cong Y_j \iff i = j$ .
- Set  $E := \text{End}_{kG}(Y)$ .

Assumptions for this section:

- Consider some  $kG$ -module  $Y$  such that  $\{S : S \mid \text{hd}(Y) \text{ simple}\} / \cong = \{T : T \mid \text{soc}(Y)\} / \cong$ .
- Let  $Y = \bigoplus_{i=1}^n Y_i$  be a decomposition into indecomposable direct summands.
- Assume: Head of  $Y_i$  is simple for all  $1 \leq i \leq n$ .
- $Y_i \cong Y_j \iff i = j$ .
- Set  $E := \text{End}_{kG}(Y)$ .

## Remark

There is a partial order ' $\geq_*$ ' on  $\{Y_i : 1 \leq i \leq n\}$ , given via:  $Y_i \geq_* Y_j$ , if and only if there is a surjection  $\varphi : Y_i \rightarrow Y_j$ .

Notation:

- Fix  $S = \text{hd}(Y_i)$  for some  $1 \leq i \leq n$ .
- Then  ${}^i\varphi_* : Y_i \rightarrow S$  may be considered as an element of  $\mathcal{F}(S) = \text{Hom}_{kG}(Y, S) \leq E$ .

Notation:

- Fix  $S = \text{hd}(Y_i)$  for some  $1 \leq i \leq n$ .
- Then  ${}^i\varphi_* : Y_i \rightarrow S$  may be considered as an element of  $\mathcal{F}(S) = \text{Hom}_{kG}(Y, S) \leq E$ .

## Lemma

*(a) Let  $\langle \psi \rangle_k \leq \mathcal{F}(S)$  be simple  $E$ -submodule. Then  $\psi$  is of the form  $\psi = {}^i\varphi_*$  for some  $1 \leq i \leq n$  such that  $\text{hd}(Y_i) \cong S$ .*

*(b) The following are equivalent.*

- (i)  $Y_i$  is maximal w.r.t.  $\geq_*$  for some  $1 \leq i \leq n$ .*
- (ii)  $\langle {}^i\varphi_* \rangle_k$  is a simple  $E$ -submodule of  $\mathcal{F}(S)$ .*

## Theorem

Let  $S$  be a simple socle constituent of  $Y$  and assume (possibly after renumbering) that  $\text{hd}(Y_k) \cong S$  for all  $1 \leq k \leq l$  for some  $l \leq n$  and that  $\text{hd}(Y_k) \not\cong S$  for all  $l + 1 \leq k \leq n$ .

(a) The following are equivalent:

- (i) The  $E$ -submodule  $\text{soc}(\mathcal{F}(S))$  has exactly  $r$  non-isomorphic constituents.
- (ii) Among  $\{Y_k : 1 \leq k \leq l\}$  there are exactly  $r$  maximal elements with respect to  $\leq_*$ .

(b) Let  $\langle \psi \rangle_k \leq E_E$  be simple  $E$ -submodule. Then there is  $1 \leq i \leq n$  such that  $\langle \psi \rangle \cong_E \langle {}^i\varphi_* \rangle$ .

## Corollary

*Assume that for each simple module occurring in the head of  $Y$  there is exactly one maximal element with respect to  $\leq_*$ .*

## Corollary

*Assume that for each simple module occurring in the head of  $Y$  there is exactly one maximal element with respect to  $\leq_*$ . Then  $\text{soc}(\mathcal{F}(S))$  is a simple  $E$ -module for each simple constituent  $S$  of  $\text{hd}(Y)$ . Moreover,*

$$\begin{aligned} \{S : S \mid \text{hd}(Y) \text{ simple}\} / \cong &\rightarrow \{T : T \mid \text{soc}(E) \text{ simple}\} / \cong \\ S &\mapsto \text{soc}(\mathcal{F}(S)) \end{aligned}$$

*is a bijection.*

Assumptions: Let  $\mathbf{B}$  be cyclic  $kG$ -block with defect group  $Q$ .

Question 3\*: Which indecomposable  $\mathbf{B}$ -modules are liftable?

# Indecomposable Lifiable Modules in Cyclic Blocks

For which families of groups does observation hold?

Joint work with Gerhard Hiss.

Assumptions: Let  $\mathbf{B}$  be cyclic  $kG$ -block with defect group  $Q$ .

Question 3\*: Which indecomposable  $\mathbf{B}$ -modules are liftable?

Kupisch 1969: Description of indecomposable  $\mathbf{B}$ -modules in terms of paths on the Brauer tree:

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type I:

Brauer tree, with multiplicity  $m = 3$  of exceptional vertex:

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type I:

Choose path:

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type I:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type I:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

From this, we get the following indecomposable  $kG$ -module:

$A_1$        $E_3$

$E_2$

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type I:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type I:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

Note: The module  $Y$  is of Type I if and only if,  $\text{soc}(Y)$  and  $\text{hd}(Y)$  have no common constituents.

# Indecomposable Liftable Modules in Cyclic Blocks

Paths of Type II:

Brauer tree, with multiplicity  $m = 3$  of exceptional vertex:

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type II:

Choose path:

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type II:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

From this, we get the following indecomposable  $kG$ -module:

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type II:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

From this, we get the following indecomposable  $kG$ -module:

$E_2 \quad B_2$

$A_1 \quad E_2$

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type II:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

From this, we get the following indecomposable  $kG$ -module:

$$\begin{array}{ccccccc}
 & & E_2 & E_3 & & & \\
 A_1 & & & & & & \\
 & E_2 & & & & & \\
 & & E_3 & & & & \\
 & & & E_2 & & & \\
 & & & & E_3 & & \\
 & & & & & B_2 & \\
 & & & & & & E_2
 \end{array}$$

# Indecomposable Lifiable Modules in Cyclic Blocks

Paths of Type II:

Choose marking on path and multiplicity  $t = 2 \leq m = 3$ :

From this, we get the following indecomposable  $kG$ -module:

$$\begin{array}{ccccccc}
 & & E_2 & E_3 & & & \\
 & A_1 & & & & & \\
 & & E_2 & & & & \\
 & & & E_3 & B_2 & & \\
 & & & & E_2 & & 
 \end{array}$$

Note: The module  $Y$  is of Type II if and only if,  $\text{soc}(Y)$  and  $\text{hd}(Y)$  have common constituents.

## Theorem

Let  $\tau$  be a path of Type I on the Brauer tree of  $\mathbb{B}$ . Then the indecomposable module  $X$  constructed from  $\tau$  is liftable if and only if  $\tau$  is as in the following figure and one of the following cases occurs:

(a)  $\chi_1$  is not the exceptional vertex. Then the character of a lift of  $X$  equals  $\chi_1$ .

## Theorem

Let  $\tau$  be a path of Type I on the Brauer tree of  $\mathbb{B}$ . Then the indecomposable module  $X$  constructed from  $\tau$  is liftable if and only if  $\tau$  is as in the following figure and one of the following cases occurs:

- (a)  $\chi_1$  is not the exceptional vertex. Then the character of a lift of  $X$  equals  $\chi_1$ .
- (b)  $\chi_1$  is the exceptional vertex, which has multiplicity  $m$ . Each of  $E_0$  and  $E_1$  occurs  $t$  times as composition factor of  $X$  for some  $1 \leq t \leq m$ . The character of any lift of  $X$  is a sum of  $t$  distinct exceptional characters.

# Indecomposable Lifiable Modules in Cyclic Blocks

Note: If  $X$  of Type I, then

- $X$  is uniserial in both cases.
- The head of  $X$  is either isomorphic to  $E_0$  or  $E_1$ .
- If the head of  $X$  is isomorphic to  $E_0$ , the successor of  $E_1$  around  $\chi_1$  equals  $E_0$ , and if the head of  $X$  is isomorphic to  $E_1$ , the successor of  $E_0$  around  $\chi_1$  equals  $E_1$ .

## Theorem

Let  $\tau$  be a path of Type II on the Brauer tree. Then the indecomposable module  $X$  constructed from  $\tau$  is liftable if and only if  $\tau$  satisfies one of the following three cases:

Case 1: The vertex  $\chi_0$  is a leaf of the Brauer tree.

# Liftable Indecomposable Modules in Cyclic Blocks

## Theorem

Let  $\tau$  be a path of Type II on the Brauer tree. Then the indecomposable module  $X$  constructed from  $\tau$  is liftable if and only if  $\tau$  satisfies one of the following three cases:

Case 1: The vertex  $\chi_0$  is a leaf of the Brauer tree.

Case 2: Either  $E_{u_0}$  is in the head or in the socle of  $X$ . If  $E_{u_0}$  is in the head of  $X$ , the successor of  $E_0$  around  $\chi_0$  is  $E_{u_0}$ . If  $E_{u_0}$  is in the socle of  $X$ , the successor of  $E_{u_0}$  around  $\chi_0$  is  $E_0$ .

## Theorem

Let  $\tau$  be a path of Type II on the Brauer tree. Then the indecomposable module  $X$  constructed from  $\tau$  is liftable if and only if  $\tau$  satisfies one of the following three cases:

**Case 3:** The successor of  $E_{u0}$  around  $\chi_0$  is  $E_0$  and  $E_{u0}$  is in the socle of  $X$ .

## Theorem

Let  $\tau$  be a path of Type II on the Brauer tree. Then the indecomposable module  $X$  constructed from  $\tau$  is liftable if and only if  $\tau$  satisfies one of the following three cases:

**Case 3:** The successor of  $E_{u0}$  around  $\chi_0$  is  $E_0$  and  $E_{u0}$  is in the socle of  $X$ .

The character of any lift of  $X$  equals  $\chi_0 + \chi_1 + \cdots + \chi_s + \mu$ , where  $\mu$  is a sum of  $t$  distinct exceptional characters.

Thank you for listening!
