# Determinantal point process

## Definition

*A determinantal point process  $A$  is a random point process such that the joint intensities have the form:*

$$\rho_n(x_1, \dots, x_n) = \det(K(x_i, x_j)_{i,j \leq n}).$$

# Determinantal point process

## Definition

A *determinantal point process*  $A$  is a random point process such that the joint intensities have the form:

$$\rho_n(x_1, \dots, x_n) = \det(K(x_i, x_j)_{i,j \leq n}).$$

Recall that the joint intensities  $\rho_k$  satisfy:

$$\mathbb{E} \sum_{x_1, \dots, x_k \in A} f(x_1, \dots, x_k) = \int f(x_1, \dots, x_k) \rho_k(x_1, \dots, x_k)$$

for any  $f$  symmetric bounded and of compact support.

## General facts

If the point process has  $n$  points almost surely then the kernel  $K$  defines an integral operator: the orthogonal projection onto a subspace of  $L^2$  of dimension  $n$ .

## General facts

If the point process has  $n$  points almost surely then the kernel  $K$  defines an integral operator: the orthogonal projection onto a subspace of  $L^2$  of dimension  $n$ .

In general

### Theorem (Macchi, Soshnikov)

*An hermitic kernel  $K(x, y)$  corresponds to a determinantal point process if and only if the integral operator  $T : L^2 \rightarrow L^2$  has all eigenvalues  $\lambda \in [0, 1]$ .*

## General facts

If the point process has  $n$  points almost surely then the kernel  $K$  defines an integral operator: the orthogonal projection onto a subspace of  $L^2$  of dimension  $n$ .

In general

### Theorem (Macchi, Soshnikov)

*An hermitic kernel  $K(x, y)$  corresponds to a determinantal point process if and only if the integral operator  $T : L^2 \rightarrow L^2$  has all eigenvalues  $\lambda \in [0, 1]$ .*

Moreover:

### Theorem (Shirai, Takahashi)

*In a determinantal process, the number of points that fall in a compact set  $D$  has the same distribution as a sum of independent Bernoulli( $\lambda_i^D$ ) random variables where  $\lambda_i^D$  are the eigenvalues of the operator  $T$  restricted to  $D$ .*

# Spherical ensembles

Krishnapur considered the following point process: Let  $A, B$  be  $n$  by  $n$  random matrices with i.i.d. Gaussian entries. Then he proved that the generalized eigenvalues associated to the pair  $(A, B)$ , i.e. the eigenvalues of  $A^{-1}B$  have joint probability density (wrt Lebesgue measure):

$$C_n \prod_{k=1}^n \frac{1}{(1 + |z_k|^2)^{n+1}} \prod_{i < j} |z_i - z_j|^2.$$

# Spherical ensembles

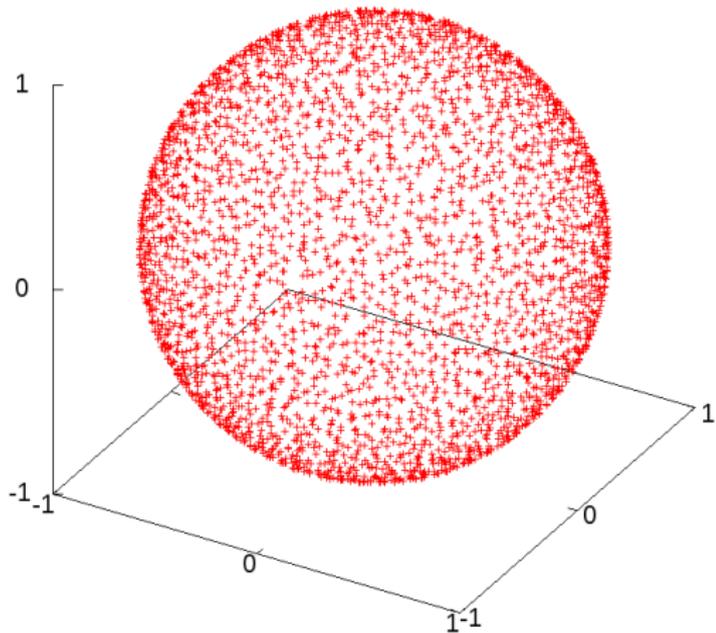

Krishnapur considered the following point process: Let  $A, B$  be  $n$  by  $n$  random matrices with i.i.d. Gaussian entries. Then he proved that the generalized eigenvalues associated to the pair  $(A, B)$ , i.e. the eigenvalues of  $A^{-1}B$  have joint probability density (wrt Lebesgue measure):

$$C_n \prod_{k=1}^n \frac{1}{(1 + |z_k|^2)^{n+1}} \prod_{i < j} |z_i - z_j|^2.$$

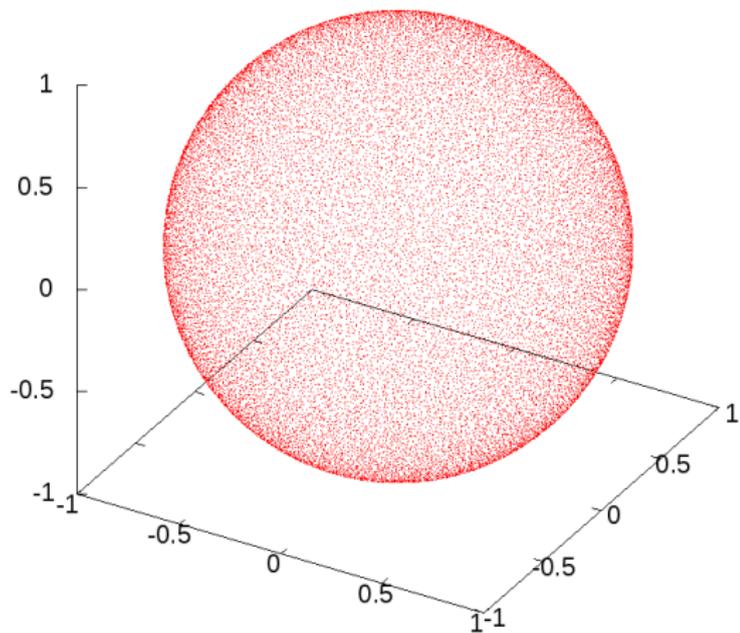

If we consider the stereographic projection to the sphere  $\mathbb{S}^2$ , then the joint density (with respect to the product area measure in the sphere) is

$$K_n \prod_{i < j} \|P_i - P_j\|_{\mathbb{R}^3}^2.$$

Spherical ensemble dimension: 3200

Spherical ensemble 25281 points

# The space of functions

Let  $P_n$  be the space functions defined as

$$q(z) = \frac{p(z)}{(1 + |z|^2)^{(n-1)/2}},$$

where  $p$  is a polynomial of degree less than  $n$ . Clearly  $P_n \subset L^2(\mu)$ , where  $d\mu(z) = 1/(1 + |z|^2)^2$ . It is a reproducing kernel Hilbert space. Its reproducing kernel is

$$K_n(z, w) = \frac{(1 + z\bar{w})^{n-1}}{(1 + |z|^2)^{(n-1)/2}(1 + |w|^2)^{(n-1)/2}}$$

# A determinantal form

We have that the matrix

$$\begin{pmatrix} \overline{q_1(z_1)} & \cdots & \overline{q_n(z_1)} \\ \vdots & \ddots & \vdots \\ \overline{q_1(z_n)} & \cdots & \overline{q_n(z_n)} \end{pmatrix} \begin{pmatrix} q_1(z_1) & \cdots & q_1(z_n) \\ \vdots & \ddots & \vdots \\ q_n(z_1) & \cdots & q_n(z_n) \end{pmatrix} = \begin{pmatrix} K_n(z_1, z_1) & \cdots & K_n(z_1, z_n) \\ \vdots & \ddots & \vdots \\ K_n(z_n, z_1) & \cdots & K_n(z_n, z_n) \end{pmatrix}$$

# A determinantal form

We have that the matrix

$$\begin{pmatrix} \overline{q_1(z_1)} & \cdots & \overline{q_n(z_1)} \\ \vdots & \ddots & \vdots \\ \overline{q_1(z_n)} & \cdots & \overline{q_n(z_n)} \end{pmatrix} \begin{pmatrix} q_1(z_1) & \cdots & q_1(z_n) \\ \vdots & \ddots & \vdots \\ q_n(z_1) & \cdots & q_n(z_n) \end{pmatrix} = \begin{pmatrix} K_n(z_1, z_1) & \cdots & K_n(z_1, z_n) \\ \vdots & \ddots & \vdots \\ K_n(z_n, z_1) & \cdots & K_n(z_n, z_n) \end{pmatrix}$$

Thus

$$\begin{vmatrix} K_n(z_1, z_1) & \cdots & K_n(z_1, z_n) \\ \vdots & & \vdots \\ K_n(z_n, z_1) & \cdots & K_n(z_n, z_n) \end{vmatrix} = \begin{vmatrix} q_1(z_1) & \cdots & q_1(z_n) \\ \vdots & & \vdots \\ q_n(z_1) & \cdots & q_n(z_n) \end{vmatrix}^2$$

Therefore the spherical ensemble generates a *determinantal* point process.

## A more general setting

Let  $(X, \omega)$  be a  $n$ -dimensional compact complex manifold endowed with a smooth Hermitian metric  $\omega$ . Let  $(L, \phi)$  be a holomorphic line bundle with a positive Hermitian metric  $\phi$ . We choose a basis of the global holomorphic sections  $s_1, \dots, s_N$  of  $H^0(X, L)$

We fix a probability measure on  $X$ , given by the normalized volume form  $\omega^n$ , that we denote by  $\sigma$ .

### Definition

Let  $\beta > 0$ . A  $\beta$ -ensemble is an  $N$  point random process on  $X$  which has joint distribution given by

$$\frac{1}{Z_N} |\det s_i(x_j)|_\phi^\beta d\sigma(x_1) \otimes \cdots \otimes d\sigma(x_N),$$

# Weak convergence of empirical measure

Given a realization  $z_1, \dots, z_{N_k}$  of the random point process we denote by  $\mu_k = \frac{1}{N_k} \sum_i \delta_{z_i}$  to the empirical measure. We take a sequence  $\mu_k, k = 1, 2, \dots$  of independent point process of the  $\beta$ -ensemble associated to  $H^0(X, L^k)$ .

# Weak convergence of empirical measure

Given a realization  $z_1, \dots, z_{N_k}$  of the random point process we denote by  $\mu_k = \frac{1}{N_k} \sum_i \delta_{z_i}$  to the empirical measure. We take a sequence  $\mu_k, k = 1, 2, \dots$  of independent point process of the  $\beta$ -ensemble associated to  $H^0(X, L^k)$ .

## Theorem

*With probability one  $\mu_n \xrightarrow{*} \sigma$ . More precisely the Kantorovich-Wasserstein distance  $KW_1(\mu_k, \sigma) \lesssim \frac{\log k}{\sqrt{k}}$  with probability one.*

# The Kantorovich-Wasserstein distance

Given a compact metric space  $K$  we define the  $KW_1$  distance between two probability measures  $\mu$  and  $\nu$  supported in  $K$  as

$$KW_1(\mu, \nu) = \inf_{\rho} \iint_{K \times K} d(x, y) d\rho(x, y),$$

where  $\rho$  is an admissible probability measure, i.e. the marginals of  $\rho$  are  $\mu$  and  $\nu$  respectively.

# The Kantorovich-Wasserstein distance

Given a compact metric space  $K$  we define the  $KW_1$  distance between two probability measures  $\mu$  and  $\nu$  supported in  $K$  as

$$KW_1(\mu, \nu) = \inf_{\rho} \iint_{K \times K} d(x, y) d\rho(x, y),$$

where  $\rho$  is an admissible probability measure, i.e. the marginals of  $\rho$  are  $\mu$  and  $\nu$  respectively. Alternatively:

$$KW_1(\mu, \nu) = \inf_{\rho} \iint_{K \times K} d(x, y) d|\rho|(x, y),$$

where  $\rho$  is an admissible complex measure, i.e. the marginals of  $\rho$  are  $\mu$  and  $\nu$  respectively

# The Lagrange functions

Given any sequence of points  $(z_1, \dots, z_{N_k})$  we define the Lagrange functions:

$$\ell_j(x) = \frac{\begin{vmatrix} s_1(x_1) & \cdots & s_1(x) & \cdots & s_1(x_{N_k}) \\ \vdots & & \vdots & & \vdots \\ s_{N_k}(x_1) & \cdots & s_{N_k}(x) & \cdots & s_{N_k}(x_{N_k}) \end{vmatrix}}{\begin{vmatrix} s_1(x_1) & \cdots & s_1(x_j) & \cdots & s_1(x_{N_k}) \\ \vdots & & \vdots & & \vdots \\ s_{N_k}(x_1) & \cdots & s_{N_k}(x_j) & \cdots & s_{N_k}(x_{N_k}) \end{vmatrix}}$$

Clearly  $\ell_j \in H^0(X, L^k)$  and  $\ell_j(x_i) = 0$  if  $i \neq j$  and  $|\ell_j(x_j)| = 1$ .

# Lagrange functions and the density function

If we denote by  $\rho_k(x_1, \dots, x_{N_k}) = \frac{1}{Z_{N_k}} |\det s_i(x_j)|_\phi^\beta$  then

$$|\ell_j(\mathbf{x})|_\phi^\beta = \frac{\rho_k(x_1, \dots, x, \dots, x_{N_k})}{\rho_k(x_1, \dots, x_j, \dots, x_{N_k})},$$

and thus  $\mathbb{E}(\|\ell_j\|_\beta) \leq 1$

# The transport plan

Consider the transport plan

$$\rho(z, w) = \frac{1}{n} \sum_{j=1}^n \delta_{z_j}(w) K_n(z, z_j) \ell_j(z) d\mu(z).$$

It has the right marginals  $\frac{1}{n} \sum \delta_{z_j}$  and  $\mu$  respectively and thus

$$KW_1(\mu_n, \mu) \leq \iint |z-w| d|\rho| \leq \frac{1}{n} \sum_{j=1}^n \int d(z, z_j) |\ell_j(z)| K_n(z, z_j) d\mu(z).$$

## Estimating the K-W distance

$$\begin{aligned}(\mathbb{E}W)^\beta &\leq \\ &\int_{X^{N_k}} \frac{1}{N_k} \sum_{j=1}^{N_k} \left( \int_X d(x, x_j) |\ell_j(x)| |K_k(x, x_j)| d\sigma(x) \right)^\beta \rho_k(x_1, \dots, x_{N_k}) d\sigma(x_i) \\ &\leq \int_{X^{N_k}} \frac{1}{N_k} \sum_{j=1}^{N_k} \left( \int_X d(x, x_j) |K_k(x, x_j)| d\sigma(x) \right)^{\beta/\beta'} \times \\ &\times \left( \int_X |\ell_j(x)|^\beta |K_k(x, x_j)| d(x, x_j) d\sigma(x) \right) \rho_k(x_1, \dots, x_{N_k}) d\sigma(x_i).\end{aligned}$$

# Off diagonal decay of the reproducing kernel

$$\sup_{y \in X} \int_X d(x, y) |K_k(x, y)| d\sigma(x) \leq \frac{C}{\sqrt{k}}.$$

Then, we obtain:

$$\begin{aligned} (\mathbb{E} W)^\beta &\leq \\ &\left( \frac{C}{\sqrt{k}} \right)^{\beta/\beta'} \int_{X^{N_k}} \frac{1}{N_k} \sum_{j=1}^{N_k} \int_X |\ell_j(x)|^\beta |K_k(x, x_j)| d(x, x_j) \rho_k(x_1, \dots, x_j, \dots, x_{N_k}) d\sigma(x) \\ &= \left( \frac{C}{\sqrt{k}} \right)^{\beta/\beta'} \int_{X^{N_k}} \frac{1}{N_k} \sum_{j=1}^{N_k} \int_X |K_k(x, x_j)| d(x, x_j) \rho_k(x_1, \dots, x, \dots, x_{N_k}) d\sigma(x) d\sigma(x_j) \end{aligned}$$

## The final estimate

Finally, integrating first in  $x_j$  and applying again the offdiagonal estimate we obtain

$$(\mathbb{E}W)^\beta \leq \left(\frac{C}{\sqrt{k}}\right)^{\beta/\beta'} \left(\frac{C}{\sqrt{k}}\right) = o\left(\frac{1}{\sqrt{k}}\right)^\beta,$$

The offdiagonal estimate for the kernel follows from the pointwise estimate for the Bergman kernel

$$|K_k(x, y)| \leq CN_k e^{-C\sqrt{k}d(x,y)},$$

which holds when the line bundle is positive,

# A concentration of measure

We want to study now the empirical measure. For determinantal process we have:

## Theorem (Pemantle-Peres)

*Let  $Z$  be a determinantal point process of  $n$  points. Let  $f$  be a Lipschitz-1 functional on finite counting measures (with respect to the total variation distance). Then*

$$\mathbb{P}(f - \mathbb{E}f \geq a) \leq 3 \exp\left(-\frac{a^2}{16(a + 2n)}\right)$$

# A concentration of measure

We want to study now the empirical measure. For determinantal process we have:

## Theorem (Pemantle-Peres)

*Let  $Z$  be a determinantal point process of  $n$  points. Let  $f$  be a Lipschitz-1 functional on finite counting measures (with respect to the total variation distance). Then*

$$\mathbb{P}(f - \mathbb{E}f \geq a) \leq 3 \exp\left(-\frac{a^2}{16(a + 2n)}\right)$$

The functional  $f(\sigma) = nKW_1(\frac{1}{n}\sigma, \mu)$  is Lipschitz-1.

## Almost sure convergence

To finish take  $a = 10\sqrt{n\log(n)}$ , then

$$\mathbb{P}\left(KW_1(\mu_n, \mu) > \frac{11\sqrt{\log(n)}}{\sqrt{n}}\right) \leq 3 \exp\left(-\frac{100n\log(n)}{16(10\sqrt{n\log(n)} + 2n)}\right) \lesssim \frac{1}{n^2}.$$

## Almost sure convergence

To finish take  $a = 10\sqrt{n\log(n)}$ , then

$$\mathbb{P}\left(KW_1(\mu_n, \mu) > \frac{11\sqrt{\log(n)}}{\sqrt{n}}\right) \leq 3 \exp\left(-\frac{100n\log(n)}{16(10\sqrt{n\log(n)} + 2n)}\right) \lesssim \frac{1}{n^2}.$$

Now a standard application of the Borel-Cantelli lemma shows that with probability one

$$KW_1(\mu_n, \mu) \leq \frac{10\sqrt{\log n}}{\sqrt{n}}.$$

# The torus

Let  $\Lambda = A\mathbb{Z}^d$  be a lattice in  $\mathbb{R}^d$ . Let  $\Omega \subset \mathbb{R}^d$  be the fundamental domain. One can identify  $\Omega$  with the flat torus  $\mathbb{R}^d/\Lambda$ .

# The torus

Let  $\Lambda = A\mathbb{Z}^d$  be a lattice in  $\mathbb{R}^d$ . Let  $\Omega \subset \mathbb{R}^d$  be the fundamental domain. One can identify  $\Omega$  with the flat torus  $\mathbb{R}^d/\Lambda$ .

The dual lattice

$$\Lambda^* = \{x \in \mathbb{R}^d : \forall \lambda \in \Lambda \quad \langle x, \lambda \rangle \in \mathbb{Z}\},$$

is given by the matrix  $(A^t)^{-1}$ .

We denote by  $|\Lambda| = |\det A|$ , the co-volume of  $\Lambda$  and  $d\mu$  is the normalized measure in  $\Omega$

# The periodic potential

For  $s > d$ , the Epstein Hurwitz zeta function for the lattice  $\Lambda$  defined by

$$\zeta_{\Lambda}(s; x) = \sum_{v \in \Lambda} \frac{1}{|x + v|^s}, \quad x \in \mathbb{R}^d,$$

is the  $\Lambda$ -periodic potential generated by the Riesz  $s$ -energy  $|x|^{-s}$ .

# The periodic potential

For  $s > d$ , the Epstein Hurwitz zeta function for the lattice  $\Lambda$  defined by

$$\zeta_{\Lambda}(s; x) = \sum_{v \in \Lambda} \frac{1}{|x + v|^s}, \quad x \in \mathbb{R}^d,$$

is the  $\Lambda$ -periodic potential generated by the Riesz  $s$ -energy  $|x|^{-s}$ .

$$F_{s,\Lambda}(x) = \zeta_{\Lambda}(s; x) + \frac{2\pi^{d/2} |\Lambda|^{-1}}{\Gamma\left(\frac{s}{2}\right) (d-s)}, \quad s > d,$$

# The periodic potential

For  $s > d$ , the Epstein Hurwitz zeta function for the lattice  $\Lambda$  defined by

$$\zeta_{\Lambda}(s; x) = \sum_{v \in \Lambda} \frac{1}{|x + v|^s}, \quad x \in \mathbb{R}^d,$$

is the  $\Lambda$ -periodic potential generated by the Riesz  $s$ -energy  $|x|^{-s}$ .

$$F_{s,\Lambda}(x) = \zeta_{\Lambda}(s; x) + \frac{2\pi^{d/2} |\Lambda|^{-1}}{\Gamma\left(\frac{s}{2}\right) (d-s)}, \quad s > d,$$

$$\sum_{v \in \Lambda} \int_1^{+\infty} e^{-|x+v|^2 t} \frac{t^{\frac{s}{2}-1}}{\Gamma\left(\frac{s}{2}\right)} dt + \frac{1}{|\Lambda|} \sum_{w \in \Lambda^* \setminus \{0\}} e^{2\pi i \langle x, w \rangle} \int_0^1 \frac{\pi^{d/2}}{t^{d/2}} e^{-\frac{\pi^2 |w|^2}{t}} \frac{t^{\frac{s}{2}-1}}{\Gamma\left(\frac{s}{2}\right)} dt$$

# The energy in the torus

For  $\omega \in \Omega^N$  define, for  $0 < s < d$ , the periodic Riesz  $s$ -energy of  $\omega = (x_1, \dots, x_N)$  by

$$E_{s,\Lambda}(\omega) = \sum_{k \neq j} F_{s,\Lambda}(x_k - x_j),$$

and the minimal periodic Riesz  $s$ -energy by

$$\mathcal{E}_{s,\Lambda}(N) = \inf_{\omega \in (\mathbb{R}^d)^N} E_{s,\Lambda}(\omega_N).$$

This was considered by Hardin, Saff and Simanek who computed the leading terms.

## Known results in the torus

Hardin, Saff, Simanek and Su proved that for  $0 < s < d$  there exists a constant  $C_{s,d}$  independent of  $\Lambda$  such that for  $N \rightarrow \infty$

$$\mathcal{E}_{s,\Lambda}(N) = \frac{2\pi^{d/2}|\Lambda|^{-1}}{\Gamma\left(\frac{s}{2}\right)(d-s)} N^2 + C_{s,d}|\Lambda|^{-s/d} N^{1+\frac{s}{d}} + o(N^{1+\frac{s}{d}}).$$

It is also shown that for  $0 < s < d$

$$C_{s,d} \leq \inf_{\Lambda} \zeta_{\Lambda}(s),$$

where  $\Lambda$  runs on the lattices with  $|\Lambda| = 1$ .

## Known results in the torus

Hardin, Saff, Simanek and Su proved that for  $0 < s < d$  there exists a constant  $C_{s,d}$  independent of  $\Lambda$  such that for  $N \rightarrow \infty$

$$\mathcal{E}_{s,\Lambda}(N) = \frac{2\pi^{d/2}|\Lambda|^{-1}}{\Gamma\left(\frac{s}{2}\right)(d-s)}N^2 + C_{s,d}|\Lambda|^{-s/d}N^{1+\frac{s}{d}} + o(N^{1+\frac{s}{d}}).$$

It is also shown that for  $0 < s < d$

$$C_{s,d} \leq \inf_{\Lambda} \zeta_{\Lambda}(s),$$

where  $\Lambda$  runs on the lattices with  $|\Lambda| = 1$ . The Epstein zeta function  $\zeta_{\Lambda}(s)$  defined by

$$\zeta_{\Lambda}(s) = \sum_{v \in \Lambda \setminus \{0\}} \frac{1}{|v|^s}, \quad s > d,$$

can be extended analytically to  $\mathbb{C} \setminus \{d\}$ .

## Some estimates

Sarnak and Strömbergsson observed that

$$\int \zeta_{\Lambda}(s) d\lambda_d(\Lambda) = 0,$$

thus  $C_{s,d} < 0$ .

## Some estimates

Sarnak and Strömbergsson observed that

$$\int \zeta_{\Lambda}(s) d\lambda_d(\Lambda) = 0,$$

thus  $C_{s,d} < 0$ .

But all explicitly known lattices in large dimensions are such that the corresponding Epstein zeta function have a zero in  $0 < s < d$ .

## Some estimates

Sarnak and Strömbergsson observed that

$$\int \zeta_{\Lambda}(s) d\lambda_d(\Lambda) = 0,$$

thus  $C_{s,d} < 0$ .

But all explicitly known lattices in large dimensions are such that the corresponding Epstein zeta function have a zero in  $0 < s < d$ .

The value of  $C_{s,d}$  it is known only for  $d = 1$  and

$C_{s,1} = \zeta_{\mathbb{Z}}(s) = 2\zeta(s)$ . For  $d = 2$  it is known that  $\inf_{\Lambda} \zeta_{\Lambda}(s)$  is attained for the triangular lattice.

# Determinantal processes and projection kernels

To define the processes we will consider only projection kernels.

## Definition

We say that  $K$  is a projection kernel if it is a Hermitian projection kernel, i.e. the integral operator in  $L^2(\mu)$  with kernel  $K$  is selfadjoint and has eigenvalues 1 and 0.

A projection kernel  $K(x, y)$  defines a determinantal process with  $N$  points a.s. if the trace for the corresponding integral operator equals  $N$ , i.e. if

$$\int_{\Omega} K(x, x) d\mu(x) = N.$$

## Translation invariant kernels

For  $w \in \Lambda^*$ , the Laplace-Beltrami eigenfunctions  $f_w(u) = e^{2\pi i \langle u, w \rangle}$  of eigenvalue  $-4\pi^2 \langle w, w \rangle$  i.e. satisfying

$$\Delta f_w + 4\pi^2 \langle w, w \rangle f_w = 0,$$

are orthonormal in  $L^2(\Omega)$ , with respect to the normalized lebesgue measure  $\mu$ ,

$$\int_{\Omega} f_w(u) \overline{f_{w'}(u)} d\mu(u) = \delta_{w, w'}$$

for  $w, w' \in \Lambda^*$ .

# Translation invariant kernels

For  $w \in \Lambda^*$ , the Laplace-Beltrami eigenfunctions  $f_w(u) = e^{2\pi i \langle u, w \rangle}$  of eigenvalue  $-4\pi^2 \langle w, w \rangle$  i.e. satisfying

$$\Delta f_w + 4\pi^2 \langle w, w \rangle f_w = 0,$$

are orthonormal in  $L^2(\Omega)$ , with respect to the normalized lebesgue measure  $\mu$ ,

$$\int_{\Omega} f_w(u) \overline{f_{w'}(u)} d\mu(u) = \delta_{w, w'}$$

for  $w, w' \in \Lambda^*$ .

We consider functions  $\kappa = (\kappa_N)_{N \geq 0}$  where each  $\kappa_N : \Lambda^* \rightarrow \{0, 1\}$  has compact support define the kernels

$$K_N(u, v) = \sum_{w \in \Lambda^*} \kappa_N(w) e^{2\pi i \langle u - v, w \rangle},$$

# Expected Energies

The expected periodic Riesz  $s$ -energy of  $T_N$  points is

$$\mathbb{E}(E_{s,\Lambda}(X)) = \int_{\Omega^2} (T_N^2 - |K_N(u, v)|^2) F_{s,\Lambda}(u - v) d\mu(u) d\mu(v).$$

# Expected Energies

The expected periodic Riesz  $s$ -energy of  $T_N$  points is

$$\mathbb{E}(E_{s,\Lambda}(x)) = \int_{\Omega^2} (T_N^2 - |K_N(u, v)|^2) F_{s,\Lambda}(u - v) d\mu(u) d\mu(v).$$

## Theorem

Let  $x = (x_1, \dots, x_{T_N})$  be drawn from the determinantal process  
Then, for  $0 < s < d$ , the expected energy is

$$\frac{2\pi^{d/2}}{\Gamma\left(\frac{s}{2}\right) (d-s) |\Lambda|^{-1}} (T_N^2 - T_N) - \frac{\pi^{s-\frac{d}{2}} \Gamma\left(\frac{d-s}{2}\right)}{\Gamma\left(\frac{s}{2}\right) |\Lambda|} \sum_{\substack{w, w' \in \Lambda^* \\ w \neq w'}} \frac{\kappa_N(w) \kappa_N(w')}{|w - w'|^{d-s}}$$

# Frequencies in an open set

## Definition

Let  $\mathcal{D} \subset \mathbb{R}^d$  be open, bounded with  $|\partial\mathcal{D}| = 0$ . Take

$$k_N(w) = \begin{cases} 1 & \text{if } w \in \Lambda^* \cap N^{1/d}\mathcal{D}, \\ 0 & \text{otherwise.} \end{cases}$$

# Frequencies in an open set

## Definition

Let  $\mathcal{D} \subset \mathbb{R}^d$  be open, bounded with  $|\partial\mathcal{D}| = 0$ . Take

$$k_N(w) = \begin{cases} 1 & \text{if } w \in \Lambda^* \cap N^{1/d}\mathcal{D}, \\ 0 & \text{otherwise.} \end{cases}$$

## Proposition

Let  $|\Lambda||\mathcal{D}| = 1$ . Then  $\mathbb{E}_{x \in (\mathbb{R}^d)^{N_*}}(E_{s,\Lambda}(x))$  is

$$\frac{2\pi^{d/2}|\Lambda|^{-1}}{\Gamma\left(\frac{s}{2}\right)(d-s)} N_*^2 - \frac{\pi^{s-\frac{d}{2}}\Gamma\left(\frac{d-s}{2}\right)}{\Gamma\left(\frac{s}{2}\right)|\Lambda|} I_{\mu^*}^{\mathcal{D}} N_*^{1+s/d} + o(N_*^{1+s/d}),$$

$$I_{\mu^*}^{\mathcal{D}} = \int_{\mathcal{D} \times \mathcal{D}} \frac{1}{|x-y|^{d-s}} d\mu^*(x) d\mu^*(y),$$

$\Omega^*$  is a fundamental domain for  $\Lambda^*$  and  $\mu^*(\Omega^*) = 1$ .

# Final optimization

A natural question is now, given a fixed lattice  $\Lambda$ , to find the optimal  $\mathcal{D} \subset \mathbb{R}^d$ .

## Theorem (Riesz inequality)

Given  $f, g, H$  nonnegative functions in  $\mathbb{R}^d$  with  $h(x) = H(|x|)$  symmetrically decreasing. Then

$$\int_{\mathbb{R}^d} \int_{\mathbb{R}^d} f(x)g(y)H(|x-y|)dxdy \leq \int_{\mathbb{R}^d} \int_{\mathbb{R}^d} \tilde{f}(x)\tilde{g}(y)H(|x-y|)dxdy,$$

where  $\tilde{f}, \tilde{g}$  are the symmetric decreasing rearrangements of  $f$  and  $g$ .

# Upper bounds for the minimal Energy

## Proposition

If we take

$$\mathcal{D} = \mathbb{B}_d(\mathbf{0}, r_d), \text{ with } r_d = \left( \frac{d}{\omega_{d-1} |\det A|} \right)^{1/d}.$$

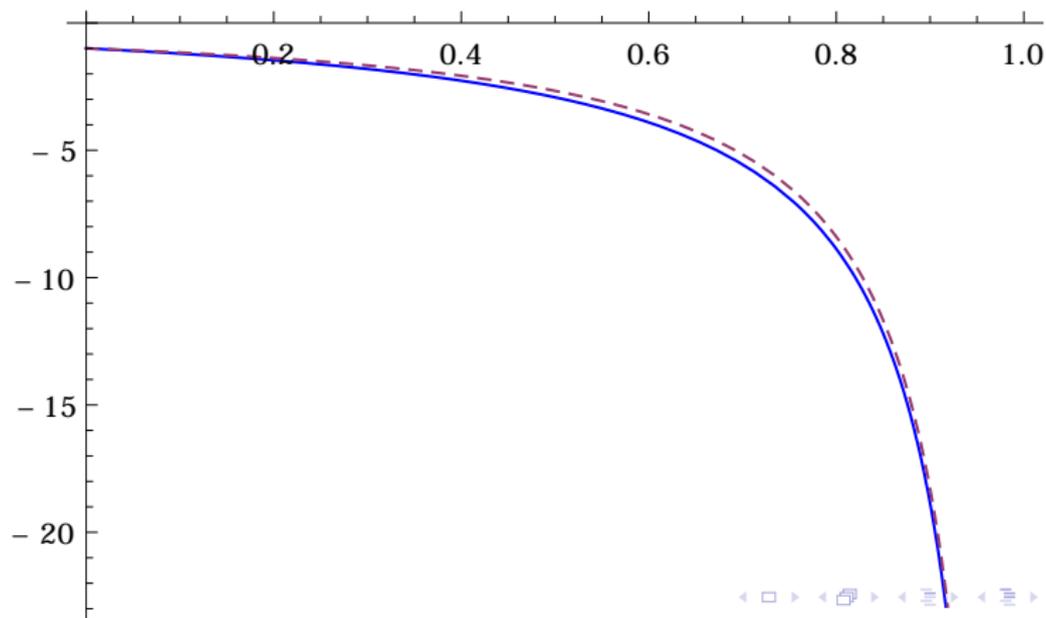

Then

$$\frac{\pi^{s-\frac{d}{2}} \Gamma\left(\frac{d-s}{2}\right)}{\Gamma\left(\frac{s}{2}\right) |\Lambda|^{1-\frac{s}{d}}} \int_{\mu^*}^{\mathcal{D}} = \frac{\Gamma\left(\frac{d-s}{2}\right) \Gamma(d+1) \Gamma\left(\frac{s+1}{2}\right)}{2^{d+1} \Gamma\left(\frac{d}{2}+1\right) \Gamma\left(\frac{s}{2}+1\right) \Gamma\left(\frac{d+s}{2}+1\right) \Gamma\left(\frac{d+1}{2}\right)}.$$

$d = 1$

In the one-dimensional case  $C_{s,1} = 2\zeta(s)$  and our bound is

$$-\frac{\pi^{s-1/2}\Gamma\left(\frac{1-s}{2}\right)}{\Gamma\left(\frac{s}{2}\right)} \frac{2}{s(s+1)}.$$

# Riesz Potentials in the sphere

Given a Riesz potential:

$$K_\alpha(x, y) = \begin{cases} |x - y|^{-\alpha} & \text{if } \alpha > 0 \\ \log |x - y|^{-1} & \text{if } \alpha = 0, \end{cases}$$

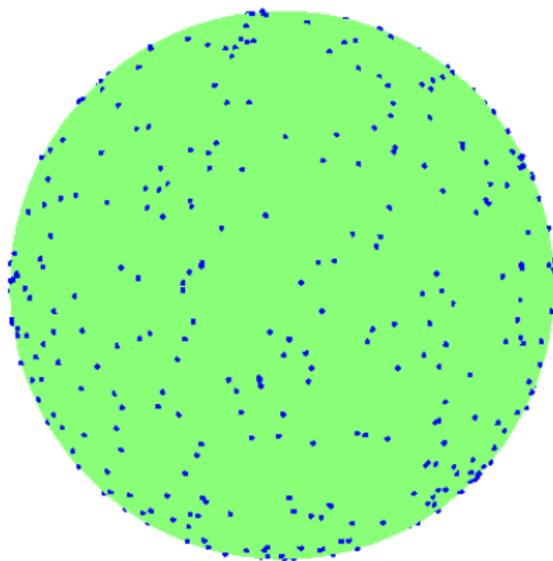

and given  $n$  points  $\mathcal{P}_n$  at the sphere, we want to minimize the energy

$$E_\alpha = \sum_{x, y \in \mathcal{P}_n, x \neq y} K_\alpha(x, y),$$

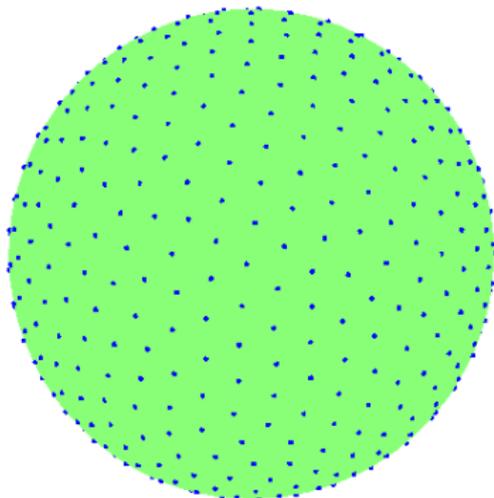

among all collections of points  $\mathcal{P}_n \subset \mathbb{S}^d$ . When  $\alpha = d - 2$  we have the Newtonian potential that corresponds to the Thomson problem. When  $\alpha \rightarrow \infty$ , we recover Tammes problem.

## “Well distributed” points on the sphere

$$\mathbb{S}^d = \{x = (x_1, \dots, x_{d+1}) \in \mathbb{R}^{d+1} : x_1^2 + \dots + x_{d+1}^2 = 1\}$$

# “Well distributed” points on the sphere

⋮ R. Womersley web <http://web.maths.unsw.edu.au/~rsw/Sphere/> 529 Fekete points

It is known that (Alexander, Stolarsky, Wagner, Kuijlaars, Saff, Brauchart) for  $d \geq 2$  and  $0 < s < d$  there exist constants  $C, c > 0$  such that

$$-cn^{1+s/d} \leq \mathcal{E}(s, n) - V_s(\mathbb{S}^d)n^2 \leq -Cn^{1+s/d},$$

for  $n \geq 2$ .

It is known that (Alexander, Stolarsky, Wagner, Kuijlaars, Saff, Brauchart) for  $d \geq 2$  and  $0 < s < d$  there exist constants  $C, c > 0$  such that

Recall that in the logarithmic case the constant exist.

# The harmonic ensemble in $\mathbb{S}^d$

Let  $\Pi_L$  of spherical harmonics of degree at most  $L$  in  $\mathbb{S}^d$ .

By Christoffel-Darboux formula the reproducing kernel of  $\Pi_L$

$$K_L(x, y) = \frac{\pi_L}{\binom{L+\frac{d}{2}}{L}} P_L^{(1+\lambda, \lambda)}(\langle x, y \rangle), \quad x, y \in \mathbb{S}^d,$$

where  $\lambda = \frac{d-2}{2}$  and the Jacobi polynomials are

$$P_L^{(1+\lambda, \lambda)}(1) = \binom{L+\frac{d}{2}}{L}.$$

By definition

$$P(x) = \langle P, K_L(\cdot, x) \rangle = \int_{\mathbb{S}^d} K_L(x, y) P(y) d\mu(y), \quad \text{for } P \in \Pi_L.$$

$\Pi_L$  is the space of polynomials in  $\mathbb{R}^{d+1}$  restricted to  $\mathbb{S}^d$ ,

$$\dim \Pi_L = \pi_L = \frac{2}{\Gamma(d+1)} L^d + o(L^d),$$

and  $K_L(x, x) = \pi_L$  for every  $x \in \mathbb{S}^d$ .

# The harmonic ensemble in $\mathbb{S}^d$

The harmonic ensemble is the determinantal point process in  $\mathbb{S}^d$  with  $\pi_L$  points a.s. induced by the kernel

$$K_L(x, y) = \frac{\pi_L}{\binom{L+\frac{d}{2}}{L}} P_L^{(1+\lambda, \lambda)}(\langle x, y \rangle)$$

# The harmonic ensemble in $\mathbb{S}^d$

The harmonic ensemble is the determinantal point process in  $\mathbb{S}^d$  with  $\pi_L$  points a.s. induced by the kernel

$$K_L(x, y) = \frac{\pi_L}{\binom{L+\frac{d}{2}}{L}} P_L^{(1+\lambda, \lambda)}(\langle x, y \rangle)$$

.

We study different aspects of this process:

# The harmonic ensemble in $\mathbb{S}^d$

The harmonic ensemble is the determinantal point process in  $\mathbb{S}^d$  with  $\pi_L$  points a.s. induced by the kernel

$$K_L(x, y) = \frac{\pi_L}{\binom{L+\frac{d}{2}}{L}} P_L^{(1+\lambda, \lambda)}(\langle x, y \rangle)$$

We study different aspects of this process:

- Expected Riesz energies
- Linear statistics and spherical cap discrepancy
- Separation distance
- Energy optimality among isotropic processes

Let  $x = (x_1, \dots, x_n)$  where  $n = \pi_L$  be drawn from the harmonic ensemble. Then, for  $0 < s < d$ ,

$$\mathbb{E}_{x \in (\mathbb{S}^d)^n}(E_s(x)) = V_s(\mathbb{S}^d)n^2 - C_{s,d}n^{1+s/d} + o(n^{1+s/d}),$$

for some explicit constant  $C_{s,d} > 0$ .

The general case (and the limiting cases) are more difficult: we improve the constants or match the order ( $s=d$ ).

Let  $x = (x_1, \dots, x_n)$  where  $n = \pi_L$  be drawn from the harmonic ensemble. Then, for  $0 < s < d$ ,

$$\mathbb{E}_{x \in (\mathbb{S}^d)^n}(E_s(x)) = V_s(\mathbb{S}^d)n^2 - C_{s,d}n^{1+s/d} + o(n^{1+s/d}),$$

for some explicit constant  $C_{s,d} > 0$ .

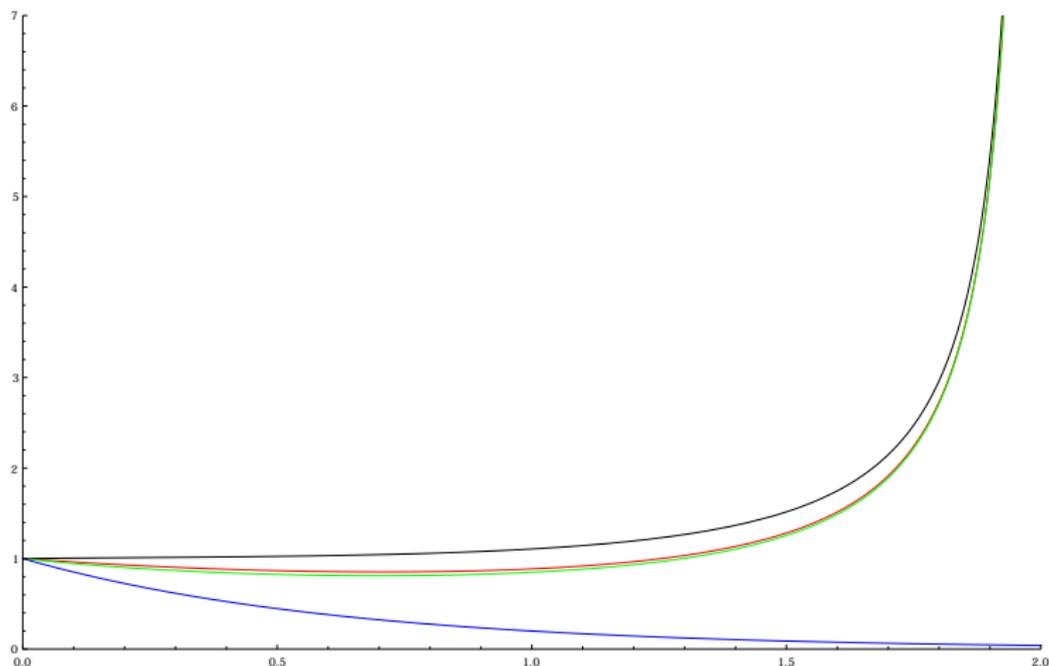

The general case (and the limiting cases) are more difficult: we improve the constants or match the order ( $s=d$ ).

For  $d = 2$  the BHS conjecture is

$$\mathcal{E}(s, n) = V_s(\mathbb{S}^2)n^2 + \frac{(\sqrt{3}/2)^{s/2} \zeta_{\Lambda_2}(s)}{(4\pi)^{s/2}} n^{1+s/2} + o(n^{1+s/2}),$$

where  $\zeta_{\Lambda_2}(s)$  is the zeta function of the hexagonal lattice (Dirichlet L-series).

d=2

: Graphic of  $-\frac{(\sqrt{3}/2)^{s/2}\zeta_{\Lambda_2}(s)}{(4\pi)^{s/2}}$  in black,  $2^{-s}\Gamma(1 - \frac{s}{2})$  (spherical) in red, the constant  $C_{s,2}$  (harmonic) in green and  $1/(2\sqrt{2\pi})^s$  in blue.

# Optimality

Can we find the best determinantal process? i.e. the kernel such that the expected energy is minimal?

Some assumptions:

# Optimality

Can we find the best determinantal process? i.e. the kernel such that the expected energy is minimal?

Some assumptions:

- Invariant by rotations i.e.

$$d(x, y) = d(z, t) \implies K(x, y) = K(z, t), \quad x, y, z, t \in \mathbb{S}^d,$$

and then  $K(\langle x, y \rangle)$  for some  $K : [-1, 1] \mapsto \mathbb{C}$ .

# Optimality

Can we find the best determinantal process? i.e. the kernel such that the expected energy is minimal?

Some assumptions:

$$(K(\langle x_i, x_j \rangle))_{1 \leq i, j \leq k},$$

is nonnegative definite.

- If we want  $n$  points a.s. in  $\mathbb{S}^d$  then all the eigenvalues must be 1 (projection kernel).

# Schoenberg theorem

We must have

$$K(x, y) = K(\langle x, y \rangle), \quad K(t) = \sum_{k=0}^{\infty} a_k C_k^{d/2-1/2}(t),$$

where  $C_k^{d/2-1/2}$  is a Gegenbauer polynomial and the  $a_k \in \left[0, \frac{2k+d-1}{d-1}\right]$  satisfy:

$$\text{trace}(K) = K(1) = \sum_{k=0}^{\infty} a_k \binom{d+k-2}{k} < \infty.$$

# Schoenberg theorem

We must have

$$K(x, y) = K(\langle x, y \rangle), \quad K(t) = \sum_{k=0}^{\infty} a_k C_k^{d/2-1/2}(t),$$

where  $C_k^{d/2-1/2}$  is a Gegenbauer polynomial and the  $a_k \in \left[0, \frac{2k+d-1}{d-1}\right]$  satisfy:

$$\text{trace}(K) = K(1) = \sum_{k=0}^{\infty} a_k \binom{d+k-2}{k} < \infty.$$

To have a projection kernel with  $n$  points we take

$$a_k \in \left\{0, \frac{2k+d-1}{d-1}\right\} \quad \text{with} \quad \sum_{k=0}^{\infty} a_k \binom{d+k-2}{k} = n. \quad (*)$$

## Theorem

Let  $K_a$  and  $K_b$  be two kernels with coefficients  $a = (a_0, a_1, \dots)$  and  $b = (b_0, b_1, \dots)$  satisfying conditions (\*). Let  $\mathbb{E}_a$  and  $\mathbb{E}_b$  denote respectively the expected value of

$$E_2(x) = \sum_{i \neq j} \frac{1}{\|x_i - x_j\|^2},$$

when  $x = (x_1, \dots, x_n)$  is given by the determinantal point process associated to  $K_a$  and  $K_b$ . Assume that for every  $i, j \in \mathbb{N}$  we have:

$$\text{if } i < j, a_i = 0 \text{ and } a_j > 0 \text{ then } b_i = 0. \quad (2)$$

Then,  $\mathbb{E}_a \leq \mathbb{E}_b$ , with strict inequality unless  $a = b$ . In particular, the harmonic kernel is optimal since (2) is trivially satisfied in that case.

# Discrepancy

There are other ways of quantifying the “equidistribution” of the point process: A measure of the uniformity of the distribution of a set  $x = \{x_1, \dots, x_n\} \subset \mathbb{S}^d$  of  $n$  points is the spherical cap discrepancy. We denote as  $d(x, y) = \arccos \langle x, y \rangle$  the geodesic distance in  $\mathbb{S}^d$ . A spherical cap is a ball with respect to the geodesic distance.

The spherical cap discrepancy of the set  $x$  is

$$\mathbb{D}(x) = \sup_A \left| \frac{1}{n} \sum_{i=1}^n \chi_A(x_i) - \mu(A) \right|,$$

where  $A$  runs on the spherical caps of  $\mathbb{S}^d$ .

Lubotzky, Philips and Sarnak found (a deterministic) construction with discrepancy smaller than  $\frac{(\log n)^{2/3}}{n^{1/3}}$ .

This was improved by T. Wolff to  $\frac{c}{n^{1/3}}$  and by Beck to  $n^{-\frac{1}{2}(1+\frac{1}{d})} \log n$

## Theorem

Let  $A = A_L$  be a spherical cap of radius  $\theta_L \in [0, \pi)$  with

$$\lim_{L \rightarrow \infty} \theta_L \in [0, \pi),$$

and  $L\theta_L \rightarrow \infty$  when  $L \rightarrow \infty$ . Let  $\phi = \chi_A$ . Then

$$\text{Var}(\mathcal{X}(\phi)) \lesssim L^{d-1} \log L + O(L^{d-1}),$$

where the constant is  $\lim_{L \rightarrow \infty} \theta_L^{d-1} \frac{4}{2^d \pi \Gamma(\frac{d}{2})^2}$ .

## Corollary

For every  $M > 0$  the spherical cap discrepancy of a set of  $n = \pi_L$  points  $x = (x_1, \dots, x_n)$  drawn from the harmonic ensemble satisfies

$$\mathbb{D}(x) = O(L^{-\frac{d+1}{2}} \log L) = O(n^{-\frac{1}{2}(1+\frac{1}{d})} \log n)$$
