Chapter 1	Modeling Tools for Financial Options	1
1.1	Options	1
1.2	Model of the Financial Market	8
1.3	Numerical Methods	12
1.4	The Binomial Method	14
1.4.1	A Discrete Model	15
1.4.2	Derivation of Equations	16
1.4.3	Solution of the Equations	18
1.4.4	A Basic Algorithm	19
1.4.5	Improving the Convergence	22
1.4.6	Sensitivities	25
1.4.7	Extensions	26
1.5	Risk-Neutral Valuation	26
1.6	Stochastic Processes	30
1.6.1	Wiener Process	31
1.6.2	Stochastic Integral	32
1.7	Diffusion Models	36
1.7.1	Itô Process	37
1.7.2	Geometric Brownian Motion	38
1.7.3	Risk-Neutral Valuation	41
1.7.4	Mean Reversion	43
1.7.5	Vector-Valued SDEs	43
1.8	Itô Lemma and Applications	46
1.8.1	Itô Lemma	46
1.8.2	Consequences for Geometric Brownian Motion	47
1.8.3	Integral Representation	48
1.8.4	Bermudan Options	49
1.8.5	Empirical Tests	51
1.9	Jump Models	53
1.10	Calibration	57
	Notes and Comments	61
	Exercises	65

Chapter 2	Generating Random Numbers with Specified Distributions	75
2.1	Uniform Deviates	76
2.1.1	Linear Congruential Generators	76
2.1.2	Quality of Generators	77
2.1.3	Random Vectors and Lattice Structure	78
2.1.4	Fibonacci Generators	81
2.2	Extending to Random Variables From Other Distributions	82
2.2.1	Inversion	83
2.2.2	Transformations in \mathbb{R}^1	85
2.2.3	Transformations in \mathbb{R}^n	86
2.3	Normally Distributed Random Variables	87
2.3.1	Method of Box and Muller	87
2.3.2	Variant of Marsaglia	88
2.3.3	Correlated Random Variables	90
2.4	Monte Carlo Integration	92
2.5	Sequences of Numbers with Low Discrepancy	95
2.5.1	Discrepancy	95
2.5.2	Examples of Low-Discrepancy Sequences	97
	Notes and Comments	100
	Exercises	103
Chapter 3	Monte Carlo Simulation with Stochastic Differential Equations	109
3.1	Approximation Error	111
3.2	Stochastic Taylor Expansion	114
3.3	Examples of Numerical Methods	117
3.4	Intermediate Values	121
3.5	Monte Carlo Simulation	122
3.5.1	Integral Representation	122
3.5.2	Basic Version for European Options	123
3.5.3	Bias	126
3.5.4	Variance Reduction	128
3.5.5	Application to an Exotic Option	132
3.6	Monte Carlo Methods for American Options	134
3.6.1	Stopping Time	134
3.6.2	Parametric Methods	136
3.6.3	Regression Methods	138
3.7	Accuracy, and Sensitivity	142
	Notes and Comments	148
	Exercises	150
Chapter 4	Standard Methods for Standard Options	155
4.1	Preparations	156

4.2	Foundations of Finite-Difference Methods	158
4.2.1	Difference Approximation	158
4.2.2	The Grid	159
4.2.3	Explicit Method	161
4.2.4	Stability	163
4.2.5	An Implicit Method	166
4.3	Crank-Nicolson Method	167
4.4	Boundary Conditions	170
4.5	American Options as Free Boundary Problems	173
4.5.1	Early-Exercise Curve	174
4.5.2	Free Boundary Problem	178
4.5.3	Black-Scholes Inequality	180
4.5.4	Penalty Formulation	181
4.5.5	Obstacle Problem	181
4.5.6	Linear Complementarity for American Put Options	183
4.6	Computation of American Options	184
4.6.1	Discretization with Finite Differences	185
4.6.2	Reformulation and Analysis of the LCP	187
4.6.3	An Algorithm for Calculating American Options	190
4.7	On the Accuracy	195
4.7.1	Elementary Error Control	196
4.7.2	Extrapolation	199
4.8	Analytic Methods	199
4.8.1	Approximation Based on Interpolation	201
4.8.2	Quadratic Approximation	204
4.8.3	Analytic Method of Lines	206
4.8.4	Integral Representations	209
4.8.5	Other Methods	212
4.9	Criteria for Comparisons	212
	Notes and Comments	216
	Exercises	221
Chapter 5	Finite-Element Methods	229
5.1	Weighted Residuals	231
5.1.1	The Principle of Weighted Residuals	232
5.1.2	Examples of Weighting Functions	234
5.1.3	Examples of Basis Functions	235
5.1.4	Smoothness	235
5.2	Galerkin Approach with One-Dimensional Hat Functions	236
5.2.1	Hat Functions	236
5.2.2	Assembling	239
5.2.3	A Simple Application	241
5.3	Application to Standard Options	242
5.3.1	European Options	242

5.3.2	Variational Form of the Obstacle Problem	244
5.3.3	Variational Form of an American Options	246
5.4	Two-Asset Options	250
5.4.1	Analytical Preparations	252
5.4.2	Galerkin Ansatz	252
5.4.3	The Boundary	254
5.4.4	Involved Matrices	256
5.5	Error Estimates	260
5.5.1	Strong and Weak Solutions	260
5.5.2	Approximation on Finite-Dimensional Subspaces	262
5.5.3	Quadratic Convergence	264
	Notes and Comments	267
	Exercises	269
Chapter 6 Pricing of Exotic Options		273
6.1	Exotic Options	274
6.2	Options Depending on Several Assets	276
6.3	Asian Options	280
6.3.1	The Payoff	280
6.3.2	Modeling in the Black–Scholes Framework	282
6.3.3	Reduction to a One-Dimensional Equation	283
6.3.4	Discrete Monitoring	287
6.4	Numerical Aspects	288
6.4.1	Convection-Diffusion Problems	288
6.4.2	Von Neumann Stability Analysis	292
6.5	Upwind Schemes and Other Methods	294
6.5.1	Upwind Scheme	294
6.5.2	Dispersion	297
6.6	High-Resolution Methods	299
6.6.1	Lax–Wendroff Method	299
6.6.2	Total Variation Diminishing	300
6.6.3	Numerical Dissipation	301
6.7	Penalty Method for American Options	303
6.7.1	LCP Formulation	303
6.7.2	Penalty Formulation	304
6.7.3	Discretization of the Two-Factor Model	305
	Notes and Comments	307
	Exercises	310
Chapter 7 Beyond Black and Scholes		315
7.1	Nonlinearities in Models for Financial Options	316
7.1.1	Leland’s Model of Transaction Costs	316
7.1.2	The Barles and Soner Model of Transaction Costs	318
7.1.3	Specifying a Range of Volatilities	319

7.1.4	Market Illiquidity	322
7.2	Numerical Solution of Nonlinear Black–Scholes Equations	322
7.2.1	Transformation	323
7.2.2	Discretization	325
7.2.3	Convergence of the Discrete Equations	326
7.3	Option Valuation Under Jump Processes	330
7.3.1	Characteristic Functions	331
7.3.2	Option Valuation with PIDEs	334
7.3.3	Transformation of the PIDE	336
7.3.4	Numerical Approximation	337
7.4	Application of the Fourier Transform	339
	Notes and Comments	344
	Exercises	345
Appendices		
A	Financial Derivatives	349
A1	Investment and Risk	349
A2	Financial Derivatives	350
A3	Forwards and the No-Arbitrage Principle	352
A4	The Black–Scholes Equation	354
A5	Early-Exercise Curve	359
A6	Equations With Volatility Function	362
B	Stochastic Tools	367
B1	Essentials of Stochastics	367
B2	More Advanced Topics	371
B3	State-Price Process	374
C	Numerical Methods	379
C1	Basic Numerical Tools	379
C2	Iterative Methods for $Ax = b$	386
C3	Function Spaces	388
C4	Minimization	391
C5	Viscosity Solutions	394
D	Complementary Material	397
D1	Bounds for Options	397
D2	Approximation Formula	399
D3	Software	402
